

**CORPO LEVA**

Tecnopolimero a base poliammidica (PA) rinforzato fibra vetro, nei colori Elecolors, finitura mat.

**PULSANTE DI RIPRESA**

Tecnopolimero nei colori Elecolors, finitura lucida.

**ESECUZIONI STANDARD**

Elemento di serraggio con perno di ritegno in tecnopolimero rinforzato fibra vetro, colore nero, zigrinato nella parte sporgente per facilitarne l'avvitamento iniziale. Molla di richiamo acciaio INOX AISI 302.

- **ERX-B:** boccola ottone, foro cieco filettato.
- **ERX-SST:** boccola acciaio INOX AISI 303, foro cieco filettato.
- **ERX-p:** prigioniero filettato acciaio zincato lucido, estremità terminale smussata UNI 947 : ISO 4753 (vedi Dati Tecnici a pag. A-11).
- **ERX-SST-p:** prigioniero filettato acciaio INOX AISI 303, estremità terminale smussata UNI 947 : ISO 4753 (vedi Dati Tecnici a pag. A-11).

**CARATTERISTICHE E APPLICAZIONI**

Particolarmente indicata quando l'angolo di manovra della leva è limitato per ragioni di ingombro.

Nei confronti dei vari tipi di maniglia a ripresa, con vite di ritegno in metallo, questa soluzione offre:

- assoluto isolamento elettrico per l'operatore durante la manovra
- eliminazione di parti visibili in acciaio soggette ad arrugginimento
- disinnesto della leva più confortevole.

**RESISTENZA A FATICA**

Le maniglie a ripresa sono normalmente utilizzate per manovre di serraggio ripetitive, a volte, con frequenza molto elevata.

Assume quindi particolare importanza la resistenza a fatica (a cicli di serraggio ripetuti) dell'innesto dentato tramite il quale lo sforzo di serraggio applicato alla leva viene trasmesso all'elemento filettato (boccola o prigioniero).

Da numerose prove di laboratorio effettuate con un'apposita apparecchiatura in grado di simulare le condizioni di impiego più gravose, risulta, ad esempio, che la maniglia a ripresa ERX.78 resiste senza manifestare cedimenti ad oltre 100.000 cicli di serraggio, sotto l'azione di una forza applicata di 490 N (vedi grafico).

Il particolare tecnopolimero rinforzato fibra vetro permette alle maniglie a ripresa ELESA di garantire valori di resistenza a fatica sensibilmente superiori a quelli che si verificano in condizioni normali di impiego.

**ISTRUZIONI D'USO**

Per la ripresa durante il serraggio sollevare la leva per disimpegnare la dentatura dell'elemento di serraggio e riportarla nella posizione di partenza. Rilasciando la leva, la molla di richiamo rimette automaticamente in presa la dentatura.
